

PATH System

Process & Task Hub

AI-Assisted Workflow and Knowledge Management Framework

May 2026

Executive Summary

The Tribal Gaming Commission manages a high volume of internal requests each day, but there is no consistent process for moving those requests through the organization.

Employees rely on emails, conversations, and informal messages, which leads to delays, unclear ownership, and multiple versions of the same document. In a regulated environment, this creates unnecessary risk.

This proposal introduces the PATH system (Process & Task Hub), a centralized workflow designed to improve request handling and document management. An AI-supported process manages intake, routes requests to the appropriate departments, and ensures completed work is stored in a centralized Knowledge Hub. The system uses existing tools, with added automation to improve coordination.

The goal is not to replace how people work, but to make it easier for them to do their work without chasing information or guessing who is responsible. The system can be rolled out in phases over several weeks and maintained at a low annual cost, making it a practical and low-risk improvement.

Business Case

A lot of time is lost on things that should be simple. A request comes in, but it's not clear who should start. Someone forwards it, someone else assumes it's already being handled, and progress slows down before the work even begins. When multiple departments are involved, that uncertainty multiplies.

Documents are also saved in multiple places. People work from different versions of the same document without realizing it. This results in duplicated work or forces staff to redo sections that have already been completed.

A centralized system fixes these problems. Every request starts in the same place, so nothing gets lost. The system helps direct it to the right departments so there's no waiting or guessing. Everyone sees the same information and works from the same version.

That change has a noticeable impact. Employees spend less time tracking things down and more time completing their work. It also creates more consistency across the company by keeping everyone on the same page.

System Design and Workflow

The system starts with a single, standardized request form. Instead of sending emails or mentioning something in passing, employees submit their request in one place. They provide a short description and attach any relevant files.

Once the request is submitted, the system reads it and creates a clear summary. The appropriate departments receive the request at the same time and can begin reviewing it together. Because everything is centralized, everyone works from the same document, which helps the work move forward.

When the request is complete, the final document is moved into the Knowledge Hub. This serves as the primary location for all finalized procedures, forms, and related materials.

The system organizes each document so it can be found quickly without digging through emails or shared drives.

PATH SYSTEM

PROCESS & TASK HUB

Smarter Requests. Stronger Collaboration. Better Outcomes.

CAPTURE • UNDERSTAND • ACT

MAKE SCENARIO 1: AI INTAKE & TRIAGE SYSTEM (AUTOMATION + HUMAN EXECUTION)

1

SUBMIT REQUEST

Employees submit requests through the easy-to-use portal.

EXAMPLES

- Update Jackpot Payout Procedure
- Revise Incident Reporting Form
- Update Licensing Forms
- Create Training Materials

2

AI TRIAGE

Summarize Request
AI reads the request and generates a concise summary.

Classify (Type, Priority)
AI classifies the request by type and priority.

Route to Departments
AI routes the request to the appropriate departments.

3

ASSIGN DEPARTMENTS

Audit

Finance

Compliance

Licensing

Investigations

HR

IT

Request is assigned to the appropriate departments.

4

EXECUTE & APPROVE WORK

Departments collaborate to review, edit, and approve content to ensure accuracy and compliance.

KEY ACTIVITIES

- ✓ Review & Edit
- ✓ Update Documents
- ✓ Add Comments
- ✓ Approve & Sign-Off

ORGANIZE • DISCOVER • IMPROVE

MAKE SCENARIO 2: KNOWLEDGE & RETRIEVAL SYSTEM (AUTOMATION)

5

STORE & STRUCTURE DOCUMENT

Once approved, the final document is uploaded to the AI-Powered Knowledge Hub.

AI ORGANIZES WITH:

- Auto-Generated Summaries
- Tags & Keywords
- Categories
- Related Documents
- Version History
- Metadata (author, date, source, status, etc.)
- Templates & Forms

6

SEARCH & RETRIEVE

Employees search the Knowledge Hub and instantly find relevant policies, procedures, forms, and training materials.

SEARCH EXAMPLES

jackpot payout

incident reporting

audit prep

onboarding

...and more

CONTINUOUS LEARNING LOOP

Technical Architecture

The system is built on Microsoft 365, which the Commission already uses. SharePoint and OneDrive handle document storage and version control. A SharePoint form is used to collect requests.

The system leverages the Commission's existing tools, with a small amount of automation added to improve coordination. Make.com connects the workflow behind the scenes, handling routing, notifications, and status updates. AI features within Microsoft 365 help organize and tag documents based on structured data.

Because the system builds on existing tools, it fits naturally into current workflows and does not require a major change in technology.

Budget Considerations

The proposed system is designed to be low-cost and practical. Relying on tools already in use keeps the initial investment minimal while still allowing improvements.

In its simplest form, the system can operate using existing Microsoft 365 licenses and free-tier AI tools. As the workflow matures, small enhancements can be added to improve reliability and automation without significantly increasing cost.

Cost Area	Additional Estimated Annual Cost	Additional Estimated Monthly Cost	Notes
Existing Microsoft 365 tools	\$0	\$0	Already in use
Free-tier AI tools	\$0	\$0	Used for summarization and tagging
Optional AI subscriptions	\$240-\$720	\$20-\$60	1-2 administrative users
Automation platform (Make/Power Automate)	\$120-\$360	\$10-\$30	Low-tier plan
Training / onboarding materials	\$0-\$300	\$0-\$25	Optional, based on implementation needs
Total Estimated Cost	\$0-\$1,500	\$0-\$125	

Deployment Approach

The rollout is designed to be gradual so departments can adjust without disruption. The system is introduced in phases, beginning with setup and configuration, followed by testing and validation. Once the workflow is validated, training is provided and the system is launched across the organization. Ongoing monitoring allows for adjustments based on actual usage.

Phase	Timeframe	Focus
Preparation	Week 1	Workflow design, form setup, SharePoint structure
Build & Configuration	Week 2	Automation, routing, notifications
Workflow Setup	Week 3	Department collaboration, Knowledge Hub setup
Testing & Validation	Week 4	System testing and adjustments
Training & Launch	Week 5	Staff onboarding and rollout
Monitoring & Refinement	Weeks 6–8	Improvements based on usage

Ethical, Legal, and Compliance Considerations

All documents remain within Microsoft 365, ensuring that sensitive information stays protected. Existing access controls continue to apply, maintaining consistency with current security practices.

AI is used to support the process, not replace decision-making. Departments remain responsible for reviewing and approving their work.

The system improves audit readiness by maintaining clear records of requests, updates, and finalized documents.

The system is relatively low risk, but some key areas should be addressed to ensure a smooth rollout.

Risk	Mitigation
Over-reliance on AI suggestions	Maintain human review at every stage
Inconsistent adoption across departments	Provide regular training and set clear expectations
Employees submit unclear or incomplete requests	Use structured form fields, provide examples and allow clarification
Version confusion during transition	Establish the Knowledge Hub as a centralized repository for procedures, forms, and other key documents
Data handling concerns	Keep all processing within Microsoft 365 and avoid using external AI tools to analyze sensitive documents.

Conclusion

This proposal presents a practical and scalable way to improve how the Commission manages internal work. By introducing a structured workflow and a centralized Knowledge Hub, the organization can reduce inefficiencies, improve coordination, and strengthen compliance without requiring significant changes to existing systems.

The approach is intentionally simple, building on tools already in use and adding targeted automation where it provides the most value. With a low cost and manageable rollout, the system offers a clear path to improving day-to-day operations while supporting long-term organizational needs.

PATH | PROCESS & TASK HUB

PATH System: Process & Task Hub

Improving Request Handling &
Document Management

 Jordan Brown — May 2026

PATH | PROCESS & TASK HUB

Summary

-  Centralized workflow for internal requests
-  AI-supported intake and routing
-  Shared document access
-  Knowledge Hub for finalized materials
-  Low-cost, low-risk improvement

2

Current Challenges

Requests scattered across email, chat, and conversations

No unified tracking or ownership

Multiple document versions

Delays in a regulated environment

Time wasted coordinating

3

What PATH Introduces

Standardized request form

Automated routing

Shared Microsoft 365 access

Real-time visibility

Knowledge Hub storage

4

Technical Architecture

5

Workflow Diagram

6

Business Case

Organizational Benefits

- ✓ Clear ownership and accountability
- ✓ Faster request handling
- ✓ Consistent processes and documentation
- ✓ Greater transparency and visibility

Financial Benefits

- ✓ Low implementation cost
- ✓ Reduced coordination time and effort
- ✓ Optional upgrades to scale as needed

7

Budget Overview

Item	Estimated Cost (USD)
Microsoft 365	\$0
Free AI Tools	\$0
Optional AI	\$240 – \$720
Automation	\$120 – \$360
Training	\$0 – \$300
Total	\$0 – \$1,500

8

Deployment Timeline

Ethical & Compliance Considerations

- All documents stay in Microsoft 365
- Existing access controls apply
- AI supports but does not replace human review
- Clear audit trails
- Reduced version confusion
